Zero-Knowledge Proofs for Auditable Decentralized Identity Tunnels

Paper ID Reference: PAP-2026-006

Authors: Contact Author 6, Co-Author 7

Abstract: We present a decentralized authentication bridge allowing credential verification without leaking email IDs, addresses, or metadata.

1. INTRODUCTION: Recent advancements in AI systems require specialized benchmarking and flow-control safety bounds. This paper details our methodology, design specifications, and test results.

2. METHODOLOGY: We establish secure sandboxes and expose APIs over local channels, observing execution behavior across various stress matrices.

3. RESULTS: Our experiments demonstrate strong resilience, yielding notable efficiency gains of up to 18% in baseline routing tasks.
