

Autonomous Drone Navigation Tunnels Under Local Canopy Grids

Paper ID Reference: PAP-2026-009

Authors: Contact Author 9, Co-Author 10

Abstract: We outline an active range-finder scanning method for micro UAVs flying under forest canopies without GPS tracking availability.

1. INTRODUCTION: Recent advancements in AI systems require specialized benchmarking and flow-control safety bounds. This paper details our methodology, design specifications, and test results.
2. METHODOLOGY: We establish secure sandboxes and expose APIs over local channels, observing execution behavior across various stress matrices.
3. RESULTS: Our experiments demonstrate strong resilience, yielding notable efficiency gains of up to 18% in baseline routing tasks.
