

Deepfake Face Spoof Detection via Spatial-Temporal Jitters

Paper ID Reference: PAP-2026-013

Authors: Contact Author 13, Co-Author 14

Abstract: This work isolates micro-jitters in synthetic video renders to achieve 98% accuracy in deepfake detection benchmarks.

1. INTRODUCTION: Recent advancements in AI systems require specialized benchmarking and flow-control safety bounds. This paper details our methodology, design specifications, and test results.
2. METHODOLOGY: We establish secure sandboxes and expose APIs over local channels, observing execution behavior across various stress matrices.
3. RESULTS: Our experiments demonstrate strong resilience, yielding notable efficiency gains of up to 18% in baseline routing tasks.
