

Auditable Cloud Storage Auditing via Verifiable Data Lattices

Paper ID Reference: PAP-2026-014

Authors: Contact Author 14, Co-Author 15

Abstract: We propose a verification protocol where cloud storage providers prove data integrity without letting auditors read file contents.

1. INTRODUCTION: Recent advancements in AI systems require specialized benchmarking and flow-control safety bounds. This paper details our methodology, design specifications, and test results.
2. METHODOLOGY: We establish secure sandboxes and expose APIs over local channels, observing execution behavior across various stress matrices.
3. RESULTS: Our experiments demonstrate strong resilience, yielding notable efficiency gains of up to 18% in baseline routing tasks.
