

Lattice-Based Zero-Leakage Compilers for Untrusted Enclaves

Paper ID Reference: PAP-2026-011

Authors: Contact Author 11, Co-Author 12

Abstract: A compiler pipeline that guarantees compilation steps don't leak information via side-channels inside secure hardware enclaves.

1. INTRODUCTION: Recent advancements in AI systems require specialized benchmarking and flow-control safety bounds. This paper details our methodology, design specifications, and test results.
2. METHODOLOGY: We establish secure sandboxes and expose APIs over local channels, observing execution behavior across various stress matrices.
3. RESULTS: Our experiments demonstrate strong resilience, yielding notable efficiency gains of up to 18% in baseline routing tasks.
